GOVERNMENT AND EDUCATION SALES

This publisher offers discounts on this book when ordered in quantity for bulk purchases, which may include electronic versions. For more information, please contact U.S. Government and Education Sales 1-855-447-2665 or email sales@hpepressbooks.com.

Feedback Information

At HPE Press, our goal is to create in-depth reference books of the best quality and value. Each book is crafted with care and precision, undergoing rigorous development that involves the expertise of members from the professional technical community.

Readers' feedback is a continuation of the process. If you have any comments regarding how we could improve the quality of this book, or otherwise alter it to better suit your needs, you can contact us through email at hpepress@epac.com. Please make sure to include the book title and ISBN in your message.

We appreciate your feedback.

HPE Aruba Contributors: Fardin Rahim Raoufi, Kevin Zhu, Kimberly Graves, Leo Banville, Venu Dhanraj Puduchery

HPE Press Program Manager: Michael Bishop

About the Authors

The material in this Study Guide was developed by the Aruba Education Development team of Leo Banville, Venu Dhanraj Puduchery, Kevin Zhu, Fardin Rahim Raoufi, and Kimberly Graves.

About the Technical Editor

Steve Sowell has been an IT professional and entrepreneur since 1984, with a focus on WLAN technologies for the past 16 years. He has sold, designed, and deployed WLANs covering millions of square feet, for sporting arenas, hospitals, offices, and outdoor areas. He has been a courseware developer, editor, and author for fifteen years, and an industry-certified instructor and engineer since 1994.

Introduction

This study guide is based on the Aruba courseware title Scalable WLAN Design and Implementation. It will help you to prepare to take the Aruba Certified Mobility Professional (ACMP) exam. The material in this book will also help you to understand advanced features of an HPE Aruba WLAN solution, and to understand, deploy, and configure scalable HPE Aruba-based WLAN systems.

Certification and Learning

Hewlett Packard Enterprise Partner Ready Certification and Learning provides end-to-end continuous learning programs and professional certifications that can help you open doors and succeed in the idea economy. We provide continuous learning activities and job-role based learning plans to help you keep pace with the demands of the dynamic, fast paced IT industry; professional sales and technical training and certifications to give you the critical skills needed to design, manage and implement the most sought-after IT disciplines; and training to help you navigate and seize opportunities within the top IT transformation areas that enable business advantage today.

As a Partner Ready Certification and Learning certified member, your skills, knowledge, and real-world experience are recognized and valued in the marketplace. To continue your professional and career growth, you have access to our large HPE community of world-class IT professionals, trend-makers and decision-makers. Share ideas, best practices, business insights, and challenges as you gain professional connections globally.

To learn more about HPE Partner Ready Certification and Learning certifications and continuous learning programs, please visit <http://certification-learning.hpe.com>.

Audience

This book is designed for presales solution architects involved in supporting the sale of scalable, enterprise-class HPE Aruba WLAN solutions. It is also designed for engineers that need to learn how to deploy and configure these solutions.

Assumed Knowledge

Typical candidates for this certification are networking IT professionals with a minimum of one to two years' experience in deploying mobility solutions for the enterprise. It is assumed that you have a good understanding of working with WLAN technologies and have an interest in learning about how to deploy the HPE Aruba product portfolio in larger, more complex, and more scalable solutions.

Since this book covers more advanced level topics and information, it is assumed that you have already completed the Implementing Aruba WLAN course or have studied the material within the related Aruba Certified Mobility Associate Study Guide.

Minimum Qualifications

The pre-requisite qualifications for the Aruba Certified Mobility Professional (ACMP) V8 certification are the Aruba Certified Mobility Associate (ACMA) V8 or Aruba Certified Mobility Associate (ACMA) V6.4 certifications.

Relevant Certifications

After you pass these exams, your achievement may be applicable toward more than one certification. To determine which certifications can be credited with this achievement, log in to The Learning Center and view the certifications listed on the exam's More Details tab. You might be on your way to achieving additional certifications.

Preparing for Exam HPE6-A44

This self-study guide does not guarantee that you will have all the knowledge you need to pass the exam. It is expected that you will also draw on real-world experience and would benefit from completing the hands-on lab activities provided in the instructor-led training.

Recommended HPE Training

Recommended training to prepare for each exam is accessible from the exam's page in The Learning Center. See the exam attachment, "Supporting courses," to view and register for the courses.

Obtain Hands-on Experience

You are not required to take the recommended, supported courses, and completion of training does not guarantee that you will pass the exams. Hewlett Packard Enterprise strongly recommends a combination of training, thorough review of courseware and additional study references, and sufficient on-the-job experience prior to taking an exam.

Exam Registration

To register for an exam, go to http://certification-learning.hpe.com/tr/certification/learn_more_about_exams.html

CONTENTS

1	Introduction and Aruba Architecture.....	1
	Aruba Architecture review	1
	OS 8.X architecture.....	1
	Master-Local versus MM-MC.....	3
	MC as L2 switch or L3 router	4
	AP terminology	5
	Configuration hierarchy.....	6
	Partial configuration model (Master-Local)	6
	Full configuration model (Mobility Master)	6
	Hierarchical configuration/monitoring model.....	7
	Hierarchical configuration (device)	8
	Forwarding WLAN user traffic.....	9
	Remote access options.....	10
	Tunneled node	11
	IAP clusters.....	11
	Learning check	12
	Aruba OS Features	13
	Aruba firewall	13
	Clustering overview.....	14
	MM AirMatch.....	15
	ClientMatch.....	17
	MultiZone AP.....	18
	Loadable Service Modules	19
	Learning check	20
	Multi-site MM/MC topology	20
2	Mobility Master Redundancy.....	23
	MM redundancy overview	23
	Why MM redundancy?	23
	MM redundancy overview	24
	MM redundancy components.....	25
	VRRP configuration.....	26
	VRRP operation	26
	VRRP configuration	27
	VRRP pre-emption.....	28

VRRP packet capture	29
Checking VRRP status	30
Learning check	31
MM redundancy DB synchronization	32
MM database synchronization	32
MM synchronization warning	33
MM redundancy IPsec parameter	34
Enable Master redundancy DB synchronization	35
Check MM redundancy status	36
Validating MM DB synchronization	37
Learning check	37
3 Mobility Master and MC Operations.....	39
MM redundancy overview	39
MM architecture	39
Architecture at a glance	40
Multi-Controller configuration	40
Adding MD/MC manually.....	41
MC Zero Touch Provisioning	42
Learning check	42
Licenses.....	43
Calculating licensing requirements	43
Licenses.....	43
Advanced licensing features	46
Device-specific (physical controller) licenses	46
License pool.....	47
Global pool (MM).....	47
Dedicated license pools	48
Learning check	49
Creating a global pool	49
Creating a local license pool.....	50
Adding a device-specific license.....	51
Learning check	52
4 MultiZone	53
MultiZone overview	53
MultiZone terminology.....	54
What is a zone?	54
Zone roles	55
What is a MultiZone AP?.....	56

MultiZone topology examples	57
MultiZone AP functional flow	58
MultiZone configuration.....	58
MultiZone WebUI configuration	58
Step 1: Create MultiZone profile on PZ	59
Step 2: MultiZone profile parameters.....	60
Step 3: Attach the MultiZone profile to an AP group	61
Step 4: Configure same AP group name in DZ	61
Step 5: DZ—Configure and assign WLAN to AP group	62
MultiZone CPsec on DZ	63
DZ licenses	64
MultiZone limitations	64
Learning check	64
MultiZone common troubleshooting commands	65
Troubleshooting—show log security	65
Troubleshooting—show ap database	65
Troubleshooting—show ap debug multizone	65
DZ WLAN configuration.....	66
Troubleshooting—show ap bss-table.....	66
Troubleshooting—show log system (n)	67
Learning check	67
MultiZone use cases	68
MultiZone AP use case—Multi-tenancy	68
MultiZone AP use case—guest access	69
Guest access solution in AOS 6.X.....	70
Guest access solution in AOS 8.1	71
Learning check	72
5 Introduction to Clusters	73
Clustering overview	73
What is clustering?.....	73
Why clustering?	73
Cluster deployment considerations.....	75
Cluster capacity	76
Learning check	76
Clustering mechanism.....	77
Cluster handshake	77
Cluster leader election	78
Cluster leader role.....	79
Cluster connection types	80
L2 versus L3 cluster member connections.....	81

Cluster redundancy	82
Cluster role introduction.....	82
Cluster roles - AAC	83
Cluster roles—AAC failover	84
Cluster roles—UAC.....	85
Cluster roles—UAC anchoring	87
Cluster roles—mapping table.....	88
Cluster GRE tunnels.....	90
Client stateful failover	90
Stateful failover conditions.....	90
Stateful failover functionality	92
Clustering (8.X) versus AP Fast Failover (6.X)	93
Learning check	93
Clustering configuration and monitoring	94
Cluster configuration—Step 1	94
Cluster configuration—Step 1 (cont.)	94
Cluster configuration—Step 2	95
Basic cluster show commands	96
Cluster dashboard	96
Monitor A-AAC/S-AAC cluster roles	97
Monitor A-UAC/S-UAC cluster roles	98
Learning check	98
6 Advanced Clustering	99
Cluster load balance overview	99
Client load balancing	99
Reason for client LB	99
Reason for Client LB (cont.)	101
Client LB triggers.....	102

Redundancy example	116
Cluster and AP groups	117
Learning check	118
Additional advanced features	118
The apmove command	118
apmove example	119
Authorization without Authorization Server Interaction (ASI)	119
Authorization with ASI	121
Configuring VRRP	124
VRRP validation	125
VRRP validation (cont.)	127
Learning check	127
Clustering troubleshooting	127
Cluster formation issue	127
Cluster not L2-connected	129
Learning check	129
7 Mobility	131
Mobility overview	131
Mobility (roaming) overview	131
Standard 802.11 mobility	132
Aruba mobility	134
Learning check	134
Legacy mobility	135
Aruba centralized management	135
Single controller mobility	136
Legacy inter-controller mobility	137
Legacy Layer 2 mobility	138
Enabling legacy inter-controller L2 mobility	139
Legacy Layer 3 IP mobility	140
Legacy Layer 3 mobility example	142
Mobility domain roaming	143

Configure legacy inter-controller L3 mobility.....	144
Define L3 domain and Home Agents Table (HAT).....	144
Enable IP mobility per MC	145
Enable mobile IP per VAP	146
Monitor mobile clients	147
Clustering mobility	148
L2 clustering mobility overview.....	148
Clustering mobility example (L2 or L3)	150
Monitor clusters	152
Learning check	152
802.11r (Fast BSS Transition)	153
IEEE 802.11r.....	153
802.11r configuration.....	155
Validate client support for 802.11r.....	157
Learning check	157
8 Advanced Security.....	159
Multiple RADIUS servers and AAA fast connect.....	159
Advantage of multiple RADIUS servers	159
Server list order—fall through	159
Server list order—fail through	160
Enabling fail-through and load-balancing.....	161
Dynamic server selection	162
Writing server matching rules	163
Matching rules.....	164
Trim FQDN option	165
Learning check	166
EAP termination	166
EAP authentication.....	166
AAA FastConnect/EAP Termination.....	167
Enabling AAA FastConnect	168
Machine authentication	169
Role assignment with machine authentication enabled	170
Blacklist.....	171
Blacklist due to failed authentication	171
Setting authentication failure blacklist time	172
Port and VLAN ACLs.....	172
Port ACLs versus VLAN ACLs	172
Wired access control.....	173
Controller ports.....	174

Wired AAA profile examples.....	174
Wired port settings in AP.....	175
Mapping AAA profile	176
Mapping Ethernet link and wired AP profiles.....	177
Wired port controller settings.....	178
Mapping AAA profile to a VLAN interface	179
Learning check	180
Global firewall settings.....	180
Certificates	182
Client and server certificates	182
Obtaining server certificates	182
Import certificate to controller.....	183
Checking CRLs and expiration alert.....	184
Learning check	184

1 Introduction and Aruba Architecture

LEARNING OBJECTIVES

- ✓ This module provides a review of the Aruba architecture. You will learn about controller roles, redundancy, and licensing before exploring hierarchy and configuration.
- ✓ Then you will review Mobility Controller (MC) use as an L2 switch or L3 router, along with packet flow, remote access, tunnel node, and IAP.
- ✓ Next, you will learn about Aruba features, roles, policies, and rules. Finally, you will review clustering, redundancy, and the MultiZone feature.

Aruba Architecture review

OS 8.X architecture

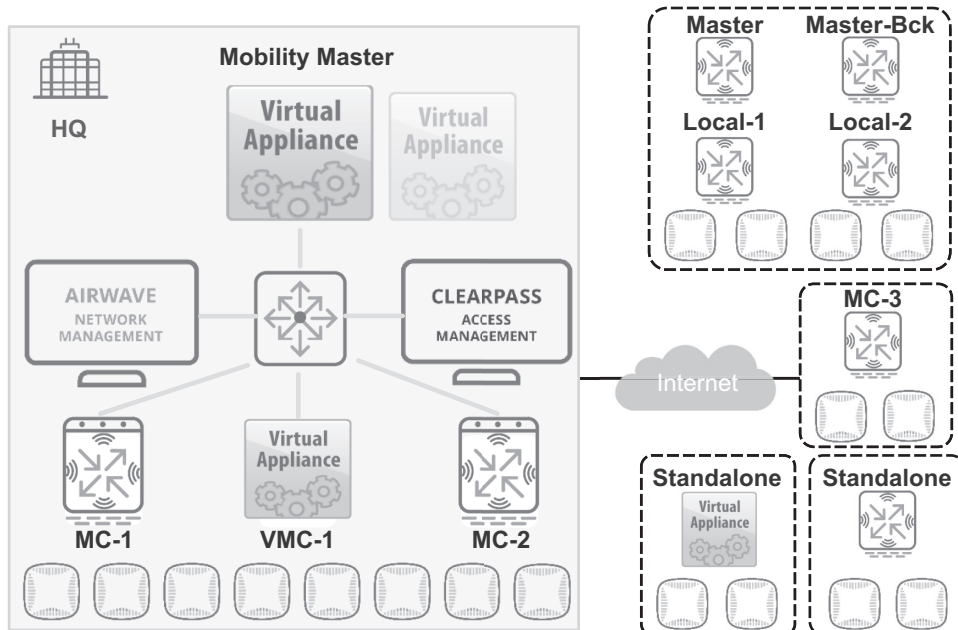

Figure 1-1 OS 8.X architecture

Figure 1-1 shows several possibilities for HPE Aruba architectural design. You choose the design that suits you best, based on scalability needs and perhaps on the pre-existing equipment.

A Mobility Master (MM) architecture can be used for medium and large networks. Figure 1-1 shows a Virtual Machine (VM)-based Virtual Mobility Master (VMM), which can run on VMware or KVM systems. You could also opt for a Hardware Mobility Master (HMM, also known as MM-HW). This is a hardened x86-based appliance, dedicated specifically to act as an ArubaOS 8 MM. For resiliency, a standby MM can be deployed on another hardware or a virtual appliance.

This design supports from 500 to 10,000 devices and up to 100,000 clients. To achieve this scalability, the MM centralizes system management and configuration but does not terminate Access Points (APs). MM is the next generation controller, with significantly more functionality and flexibility. The MM manages Mobility Controllers (MCs) and VM-based MCs (VMCs), which terminate APs. This architecture became available as of ArubaOS 8. You cannot implement this architecture with earlier ArubaOS versions.

An MC can be a part of an MM solution, as described above. An MC can also act as a so-called “standalone” controller as described below.

The MC architecture can be used for the 7000-series MCs. These “standalone” controllers can support up to 64 APs and 24 Ethernet ports. The MC can also terminate various types of VPN connections, as listed below:

- Site-to-site VPN connections from remote MCs
- Remote Access Points (RAPs)
- Instant Access Points (IAPs)
- The HPE Aruba Virtual Intranet Access (VIA) client application

If you have existing 7000-series controllers that meet your scalability requirements, this is a viable option.

Another option for smaller networks is to use a VMC architecture. Although VMCs run ArubaOS 8.x, you can create a standalone architecture, deployed like 7000-series controllers, without an MM. However, you lose some advanced 8.x features. This includes Clustering, AirMatch, and Zones.

Controllers that run ArubaOS 6.X use a Master Controller/Local Controller architecture. You know that the MC is a standalone controller, not managed by an MM. The Local Controller serves under an MC, perhaps deployed locally at another site.

You can use this same architecture with controllers that run v8.0.1 and later. Just remember, you lose higher-end features (Clustering, AirMatch, and Zones). This option can be used as an interim solution—a kind of “stepping-stone” to migrate from 6.X to 8.X. The migration tool used for this purpose makes reference to a Mobility Controller Master (MCM)—again, this is simply a non-MM Mobility Controller Master.

Finally, the Figure 1-1 shows two options that can add compelling value to your deployment, as described below:

- AirWave is an SNMP-based network operations system that can manage wired and wireless infrastructure from Aruba and many third-party systems. You get granular visibility into devices, users, and applications. This increases your situational awareness toward a more proactive approach to network management.
- ClearPass is a policy manager for mobility solutions. It improves upon legacy, AAA-based authorization with context-aware policies. ClearPass can intelligently profile devices, validate endpoint health, enable Bring Your Own Device (BYOD) and Internet of Things (IoT) onboarding, all while facilitating guest access and third-party integration.

Master-Local versus MM-MC

Master-Local

An MC can only be deployed as a physical controller, and it can terminate APs. For Master-Local deployments, the Master pushes only partial configuration to all the locals. This includes AP-Groups, Local DB, Whitelist DB, and similar items. The master will not validate the configuration before pushing to the locals. In other words, issues related to syntax and the range of parameter values will not be detected.

In this model, the master cannot push L2 and L3 configuration. This means that things such as VLAN, interface, and IP routing parameters must be configured separately on each local controller.

Also, features such as the Zero-Touch Provisioning (ZTP) and Disaster Recovery mode are not supported for local controllers.

MM-MC

The MM can be deployed on both physical and virtual (VM) appliances, but they cannot terminate APs. The MM can push full configuration to all of its managed MCs, using ZTP. The MM also validates configurations before pushing them to these MCs.

ZTP automates deployment of managed devices, enabling a more “plug-n-play” type of solution. With ZTP, managed devices acquire information from the network and provision themselves automatically.

During disruptions in MM-to-MC connectivity, you can enable Disaster Recovery mode on the managed MCs. This can help you to restore connectivity.
